

REINFORCE THE PERIMETER. VENT THE FIELD.

*A SMARTER APPROACH TO MANAGING WIND UPLIFT
WITH DURO-LAST® AND VADA® VENTED ROOF SYSTEM™*

The VADA Vented Roof System is designed around how wind affects a commercial roof. A robust perimeter attachment secures areas most exposed to wind uplift, while strategically placed vents in the field help equalize pressure within the roof assembly, reducing the forces that can lift and stress the roof.

How VADA Works

Secure the Perimeter

Mechanical fasteners and adhesives work together to reinforce critical perimeter and corner areas.

Vent the Field

Strategically placed vents allow air to move within the roof assembly and help equalize pressure.

Manage Wind Uplift

By managing pressure within the roof assembly, VADA helps reduce the forces that can lift and stress the roof during high-wind conditions.

Engineered for the Project

Each VADA Vented Roof System is designed based on the building's location, size, height and roof deck.

Available through Duro-Last, the VADA Vented Roof System brings together VADA's vented roof technology and the proven performance of a Duro-Last Roofing System. Together, they provide a comprehensive approach to managing wind uplift while maintaining the performance and installation advantages contractors expect from Duro-Last.

Explore the Benefits of Duro-Last and the VADA Vented Roof System

Fewer Field Fasteners

VADA's attachment approach minimizes the need for mechanical fastening throughout the field of the roof, helping reduce installation steps and keep crews moving.

Fewer Deck Penetrations

With less field fastening required, contractors can reduce the number of penetrations through the roof deck while maintaining a streamlined installation approach.

Custom-Fabricated Components

Duro-Last roofing components are custom-fabricated to the project's specifications, reducing field fabrication and helping crews spend less time measuring, cutting and fitting materials on the roof.

A Complete Roofing Approach

VADA is available with Duro-Last PVC and Duro-TECH® TPO Roofing Systems, giving contractors the flexibility to incorporate a vented roof solution into the Duro-Last Roofing Systems they know and trust.
